PIGMENTATION

treatments have been clinically proven to safely and effectively correct and prevent unwanted pigmentation.

MAKING A VISIBLE DIFFERENCE

Advanced Solutions for Pigmentation

After years of scientific research AGERA® Rx has formulated pigmentation control treatments to effectively reduce the activity of melanocytes, the cells in the skin that produce pigment. Natural active ingredients such as kojic acid, arbutin and methyl gentisate help reduce unwanted pigmentation in even the most sensitive skin.

Pigment Suppression

AGERA® Rx has developed revolutionary skin peels that have been clinically proven to effectively reduce the appearance of pigmentation in the skin. These unique no down time peels reduce the activity of pigment producing cells deep within the skin for a flawless, even-toned complexion.

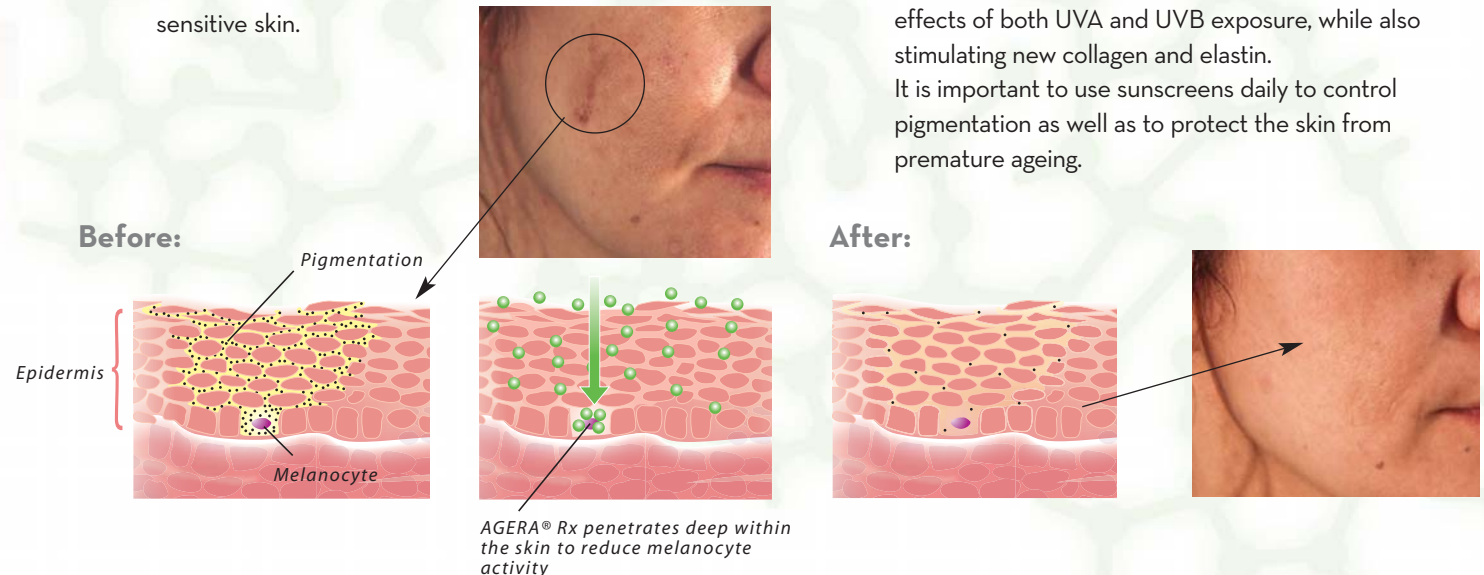

Your AGERA® Rx practitioner may also recommend medical microdermabrasion along with your series of AGERA® Rx peels.

Preventing Free Radical Damage

Free radicals are damaging agents that disrupt the normal function of skin cells. They are caused by sun exposure, pollution and other environmental factors. AGERA® Rx formulations contain powerful antioxidants that have been proven to combat free radical damage. Regular use helps prevent pigmentation formation and correct damage to collagen and elastin caused by sun exposure.

UVA / UVB Protection

AGERA® Rx sunscreens protect against the damaging effects of both UVA and UVB exposure, while also stimulating new collagen and elastin. It is important to use sunscreens daily to control pigmentation as well as to protect the skin from premature ageing.

Pigmentation significantly reduced by a series of AGERA® Rx peels and skin care products.
